# Introduction

The Uniform Wheat Variety Trial (UWVT), presented in the following pages, is coordinated and implemented by numerous Texas A&M AgriLife Research and Extension faculty and staff. We appreciate the cooperation from numerous Texas A&M AgriLife County Extension Agents, producers, universities, and private industry groups that contribute time, property, chemicals, and seed to conduct these field trials. Wheat market classes within these yield trials include Hard Red Winter Wheat (HRWW) and Soft Red Winter Wheat (SRWW).

During the 2022-23 wheat production season, Texas producers planted 6.4 million acres of wheat and harvested 2.0 million acres for grain. (National Agricultural Statistics Service, NASS).

The purpose of this publication is to provide unbiased yield data and disease and insect ratings for wheat producers across the state. Using this information, Texas wheat producers can make an educated decision concerning the most appropriate varieties for their geographic region.

## Variety Selection:

Selection of small grain varieties is one of the most important decisions a producer will make. This decision impacts potential yield (forage and grain), seed quality (test weight and protein), disease and insect management and maturity. It is important that producers diversify the varieties planted on their farms. Variety diversification spreads the risk associated with potentially devastating pests (leaf rust, stripe rust, Hessian fly, Wheat streak mosaic virus, wheat curl mite, greenbugs, etc.) and yield loss from adverse environmental factors (freeze, drought, etc.).

Producers are advised to select no fewer than 2 or 3 varieties to plant on their farms and preferably more, depending upon the size and location of fields. Variety selection should be based upon a combination of sound data from university trials and other reliable sources. Wheat varieties should be chosen based on multiple years of data (yield, pest and disease resistance, grain quality and maturity). High yield over multiple years and multiple locations demonstrates a variety's ability to perform well over diverse environmental conditions. Stable yield performance is an excellent variety selection tool. It is important to consider decreasing yields over a 2 or 3-year time frame, which may reflect a change in disease and/or insect resistance.

When selecting a variety for the 2023-24 season, producers need to consider multiple year averages, recognizing the unusual climatic conditions that impacted yield and quality over the past several years. It is strongly encouraged that producers look at the 3 and 4-year averages where available, and to look at numerous relevant variety trial locations. There are typically 20+ wheat variety trials conducted across the state each year, and most of these contain analyses for multiple years.

## **Interpreting the Data:**

Yield and test weight at each location have been analyzed using appropriate statistical procedures. The statistical analysis provides the mean, CV, and LSD values. It is important to note these statistical values to prevent misinterpretation of any replicated data.

The mean is another term for the average. Therefore, a mean yield is the average of all plots within a trial. Individual variety yields can be compared to the mean yield to determine how these varieties performed within the trial (i.e. were they above or below average?). This average can also be used as an indication of the environment for that location. A low mean yield can indicate poor growing conditions were experienced in that season; likewise, a high yield average can indicate favorable growing conditions.

The CV (Coefficient of Variation) value, expressed as a percentage, indicates the level of unexplained variability present within the trial. A high CV value indicates a lot of variability existed within the trial not related to normal variations that might be expected between the varieties in the test. This variability may be the result of non-uniform stands, non-uniform insect or disease pressure, variability in harvesting, or other issues. CV values in excess of 15% signify that there were problems in the trial, leading the reader to question the validity of the data as a true representation of varietal performance.

The LSD (Least Significant Difference) value is a numeric range to help the reader determine if the varieties performed differently from one another within the trial. If the LSD value is 5 bu/ac in a trial in which Variety A yielded 36 bu/a and Variety B yielded 30 bu/a, then Variety A is said to be significantly better. In that same trial with an LSD value of 5 bu/ac at a 0.05 (5%) significance level, the statistical inference one could say is that Variety A would yield better than Variety B in 19 out of 20 trials conducted in which there was at least a 5 bushel difference in yield. In this hypothetical comparison, you might have a 20<sup>th</sup> trial with a 5 bu/ac difference that there is not truly a statistical difference between Variety A and B, but random chance caused the 5 bushel difference.

### Certified Seed Only (CSO) and Plant Variety Protection Act: Wheat Varieties

*What farmers can and cannot do regarding saving grain for planting seed*

In the past few years, many if not most wheat seed companies have implemented additional protections on many if not most of their wheat varieties. This includes limiting planting to Certified Seed Only (CSO). This means a CSO variety can only be planted in certified seed form, which must be purchased from the developer or their licensees and designated seed dealers. This is an effort to better recapture the cost of developing and releasing a new wheat variety with the most recent breeding improvements. The development cost can be several million dollars per released variety. Wheat breeding programs potentially make tens of thousands of observations and thousands of crosses through many generations over multiple locations to find one cultivar that will be released (Fig. 1). This is an expensive, time-consuming process.

**Fig. 1.** An advanced replicated Texas A&M AgriLife Research wheat breeding nursery at Bushland, TX, June 2023. This field is an intermediate step between initial single plant breeding crosses/single row plots vs. broad regional testing at many sites leading to final selection of a cultivar for release as a new variety. (Photo courtesy Shannon Baker.)

As a condition of the farmer’s purchase of a CSO variety farmers must sign a Stewardship Agreement with the variety developer. The key agreement condition is the farmer may NOT

save any grain as seed for planting a future crop. This is a contractual matter, not a regulatory or legal matter (unless the variety also has a utility patent, see below). The developer of a CSO variety who finds a farmer in violation of a CSO agreement has the right to seek civil recourse through the court system. If a farmer is unwilling to agree to CSO terms, then they simply should not purchase a CSO variety. Fortunately, there are other good non-CSO variety choices.

Some university breeding programs including Colorado State (via their PlainsGold brand) also have adopted CSO on some varieties. Currently no AgriLife TAM varieties are CSO but there is no assurance this provision may remain in the future.

### **The Historical Plant Variety Protection Act (PVPA)**

Texas farmers are likely somewhat familiar with seed law in the form of PVPA. In wheat, PVPA allows a farmer to save grain from a variety they have purchased. They may condition/treat the amount of seed he/she can reasonably expect to plant the next cropping season from their saved grain. It is illegal to sell this saved grain to anyone else as planting seed without permission of the developer. Relabeling a PVPA variety as ‘VNS, variety not stated’ and selling it to another party is also prohibited. For a 2005 AgriLife Extension review of PVPA see <https://varietytesting.tamu.edu/wp-content/uploads/sites/17/legacy-files/wheat/docs/plantvarietyprotectionact.pdf>

Texas A&M AgriLife will be updating the above previous guide on wheat and PVPA for the 2023 wheat planting season.

#### Utility patent

Texas A&M AgriLife agricultural law Extension specialist Tiffany Dowell-Lashmet has blogged about PVPA vs. another form of seed protection, the utility patent. You can read the blog at <https://agrilife.org/texasaglaw/files/2022/01/Overview-of-Seed-Saving-Laws.pdf> (Nov 2021). A utility patent, though more expensive than PVPA, is a stronger protection of 20 years on the developer’s intellectual property. Dr. Bryan Gensch, executive director, Texas Seed Trade Association, notes that utility patents are more comprehensive and expensive to implement than standard PVPA. The main advantage is the U.S. court system more widely and readily recognizes—“understands”—the long history of patent protection in contrast to the few recent decades of PVPA.

Most wheat variety developers may also use utility patents as a means to govern the use and reuse of their varieties. A utility patent is not a requirement to designate a variety as CSO, which could simply be the developer’s conditions for purchase and enforcement of a contractual agreement for no saved seed. A utility patent, however, would provide a stronger legal basis for requiring and enforcing a CSO grower agreement. Utility patents, PVPA, and

contractual developer/grower agreements rely on the seed developer (intellectual property owner) to enforce infringements through civil courts.

One recent example of an apparent violation of CSO in Texas was revealed in an AgriLife grower variety survey estimated that there were >20,000 acres of a specific wheat variety planted. Yet a company representative share they sold only 8,000 to 9,000 units (about one unit per acre for seeding). This suggests that farmers were saving seed in violation of their Stewardship Agreement. If caught, a farmer can face major civil penalties well beyond the actual value of the seed.

### **Planting Choice of CSO Seed vs. Saving PVPA Seed**

Varieties with CSO designation may cost a little more to plant than other purchased varieties (certified or not). But they likely represent the best genetics a company or university seed program has to offer and may have utility patent traits such as CoAXiom® herbicide tolerance. It is possible farmers will likely not choose CSO varieties for drought-prone dryland regions. Saving seed under PVPA for on-farm use is one way to reduce economic risk for drier, low-yielding environments.

Texas A&M AgriLife does not endorse or discourage saving of seed under PVPA for your own use. We do encourage farmers to ensure good quality seed if saving grain for planting. This includes high germination (>95%) and a test weight of >58 lbs./bu (60 lbs./bu is standard). As a general rule of thumb, we suggest farmers using legal seed saving, consider switching out to certified seed after saving seed twice (purchase certified seed every third year). In general Texas A&M AgriLife agrees with the adage “Certified seed doesn’t cost, it pays.” Certified seed more likely ensures genetic purity, strong germination and seedling vigor, and minimal risk of seed-borne disease, or contaminant weed seed.

As of this writing companies we are aware of marketing some or most of their seed under CSO conditions include:

- WestBred (Bayer)
- SY and AgriPro brands (Syngenta)
- Dyna-Gro
- Croplan
- PlainsGold (Colorado State Univ.)
- LCS (LimaGrain)
- Agri-South Genetics

This list may not be complete. Check with your seed supplier. If you choose a CSO please read fully the Stewardship Agreement. Again, currently no Texas A&M AgriLife “TAM” varieties are CSO.

## **Elevator-Run Seed Legality (Not!)**

Can a farmer purchase bulk wheat grain from an elevator and use it as planting seed? Legally, the answer is ‘No.’ There will likely be many PVPA varieties (including all TAM lines) and some CSO varieties commingled together and from many different fields. It is possible the farmer knows that much of that grain is TAM varieties like 113, 114, 115, etc. That intent is a violation of federal seed law. This has been established in landmark court cases including a Corn Belt example where a farmer bought elevator-run soybeans knowing the soybean grain would be Roundup Ready. Monsanto took the farmer to court and won their case. The farmer’s attempt to circumvent seed law and save some money ultimately cost him many fold more than he would have saved.

You don’t have to guess. Texas A&M AgriLife would never recommend this practice, even if all you wanted was wheat seed to plant for basic ground cover. Elevator-run seed is not genetically pure, has no assurance of seed quality, and could contain seed-borne diseases that could derive from just one variety in any of 20 or more fields in that elevator bin. These are not problems you want to bring home to your farm.

## **Final Consideration for CSO Wheat Varieties**

Our intent is for Texas farmers to become more aware of the impetus for CSO wheat varieties. The decision is yours if you want to plant one on your farm. CSO varieties from most of the companies listed above are among Texas A&M AgriLife Picks for the planting season (see <http://lubbock.tamu.edu/wheat>) Ask your preferred seed dealer if the variety you are interested in is CSO. Review the Stewardship Agreement. Then make your decision. If you routinely do not save grain to plant as seed in the next wheat crop, then CSO may be a moot point.

## **Does “Certified Seed Only” Apply to Other Small Grains?**

I am not aware of CSO in other small grains with one exception (triticale). All are grown in Texas as seed blocks under developer/company supervision. Wheat and rye are the two small grains that are routinely used in cover crops.

- Oats. Significant Texas acres are harvested for grain and also hay. Oats are not grazed much.
- Barley. There are a few hundred acres grown in the Texas High Plains for grain for malting. Another High Plains elevator contracts a few thousand acres for grain for dairies. Barley is otherwise sometimes planted due to its tolerance to salty soils and salty irrigation water.
- Rye. Grown a little for hay but mostly as a cover crop.

- Triticale. This small grain is a cross between rye and wheat. It is grown mostly for silage. Some nearly beardless triticale varieties (including the TriCal brand) have a company stewardship agreement with growers does not permit saving seed.

\*New Pick, 2023-2024. ΔNew release, little seed. ¶Certified Seed Only (CSO). License bars saving own seed for planting. †Soft red winter wheat. ∞Hard white winter wheat. ‡Beardless.

Texas A&M AgriLife Extension, in collaboration with our wheat breeding program colleagues in Texas A&M AgriLife Research, highlights these wheat varieties to producers. Wheat Picks are based on a minimum of three years of data (and at least two years for a ‘Watch List’ designation) over multiple regional locations. These wheat varieties are not strictly a list of recommended wheat grain varieties. But given the data, these are varieties we would choose to include on our farm. If you are planting other varieties, and you like them, continue to plant them. But consider trying one of these regional varieties on some of your acres, especially a variety that complements your other wheat variety’s maturity and insect/disease resistances.

\*Awnless/Beardless Variety

<sup>†</sup>Varieties ranked by 3-Year, 2-Year, then 2023 forage yields.

<sup>‡</sup>Forage was clipped on 2/6/2023

Highlighted values are significantly the same as the highest values at *p*<0.05.

Bold value is the highest value within a year.

No rusts were observed in 2023.

Awnless variety was damaged by wild hogs. Grain yields are not reported.

**Note:** One forage cutting in February had no influence on the grain yield in the dual-purpose practice as compared to the grain-only practice.

Therefore, no grain yield advantage was observed in the grain-only practice.

**Picks list for 2023-2024 dual-purpose variety includes Green Hammer, WB4595, WB4792, and TAM 205.**

\*Awnless/Beardless Variety

<sup>†</sup>Varieties ranked by 3-Year, 2-Year, then 2023 forage yields.

<sup>‡</sup>Forage was clipped on 1/23/2023 and 3/1/2023.

Highlighted values are significantly the same as the highest values at *p*<0.05.

Bold value is the highest value within a year.

No rusts were observed in 2023.

Awnless variety was damaged by wild hogs. Grain yields are not reported.

**Note:** Although there were two forage clippings (January and March) in dual-purpose system in 2023, average grain yields were greater in the dual-purpose system as compared to the grain-only system. The reason for the yield difference may be due to the better ground in the dual-purpose system than the grain-only system. In addition, the March cutting did not affect the developing grain head above the first hollow stem. Low test weight may have been caused by summer drought, late harvest, and prolonged wet conditions.

**Picks list for 2023-2024 dual-purpose variety includes Green Hammer, WB4595, WB4792, and TAM 205.**

### Cultural Data for 2023 TAMU Forage Trial Locations

Region	Site Information						
	Location <sup>1</sup>	Cooperator	Yield Limiting Issue	Planting Date	Fertilizer (lb N/ac)	Water	Seeding Rate
High Plains	Bushland	TAMU AgriLife Research & Extension	Drought	9/19/2022	N/A	Limited Irrigation	1.2M Seeds/ac
Rolling Plains	Eula	--	Drought	10/21/2022	N/A	Dryland	1M Seeds/ac
	Millersview	Mickey Dillard	Drought	10/21/2022	N/A	Dryland	1M Seeds/ac
	San Angelo	TAMU AgriLife Research & Extension	Drought	10/14/2022	N/A	Dryland	1M Seeds/ac
Blacklands	McGregor	TAMU AgriLife Research Farm	Drought	10/21/2022	130	Dryland	1.2M Seeds/ac
South Texas	College Station	TAMU Brazos Bottom Research Farm	Drought	10/19/2022	50	Dryland	1.2M Seeds/ac

<sup>1</sup>All locations were planted into conventionally tilled seedbeds.

**2022-2023 Texas A&M AgriLife Small Grain Silage Trial at Bushland**

Planted 31-Oct-22

Seeding Rate (Wheat and Triticale) 1,200,000 seeds/ac  
Seeding Rate (Rye) 800,000 seeds/ac

Irrigation 7 inches

Precipitation 12.4 inches
