

## 2011 Limited Irrigated Texas Panhandle Sorghum Hay Trial

**Brent Bean<sup>1</sup>, Jake Becker<sup>2</sup>, Jake Robinson<sup>2</sup> and Dennis Pietsch<sup>3</sup>**

### Introduction

The trial consisted of 32 entries that included hybrids with the brown midrib (BMR) and photoperiod sensitive (PS) traits. Two harvests were made, with the first cutting occurring 75 days after planting on August 4<sup>th</sup> and 5<sup>th</sup> and the second cutting on November 3<sup>rd</sup> and 4<sup>th</sup>. The first harvest was delayed more than usual because of the extreme drought experienced in 2011. Percent heading for each hybrid is reported just prior to harvest. The objective of this study was to compare hybrid yields after both the first and second cuttings, as well as the total yield from both cuttings. In addition, nutrient analyses of hybrids were compared after each harvest.

### Methods and Materials

All hybrids were planted with a John Deere Max-Emerge planter equipped with seed cones. Plots consisted of two 25-ft long, 30-inch wide raised beds. Each hybrid was planted three times in a randomized block design. Because of the extreme drought, plots were irrigated three times during the season with a total of 8.5 inches of water. Rainfall totaled less than 2 inches during the growing season with no single rainfall event totaling more than 0.5 inches. Harvest was achieved with a Carter Harvester. Immediately following each harvest a fresh weight was obtained. A subsample of the chopped plants was collected to determine percent moisture at harvest. Following drying, the samples were stored for shipping to Dairyland Laboratories, Arcadia, WI for forage quality analysis. Other cultural practices and study information are listed below:

Trial Location:	Bush farm located one mile north of Bushland, TX
Cooperator:	Texas AgriLife Research
Previous Crop:	Fallow
Soil Type:	Pullman Clay Loam, pH = 7.4
Plot Size:	Two, 30 inch rows by 25 ft
Replications:	3
Study Design:	Randomized complete block
Planting Date:	May 19 <sup>th</sup> , 2011
Planting Rate:	100,000 seed/acre
Seed Method:	John Deere Max-Emerge planter with seed cones.
Fertilizer:	Applied 50 lb/acre N and 50 lb/acre P <sub>2</sub> O <sub>5</sub> based on soil test results.
Herbicide:	One lb/acre atrazine applied five days after planting
Irrigation:	2.8 inches on July 19 <sup>th</sup> , 3.7 inches after first cutting on August 9 <sup>th</sup> , 1.9 inches on September 2 <sup>nd</sup> .

### Nutrient analyses:

Crude Protein:	6.25 * % total nitrogen
TDN:	Estimate of total digestible nutrients

<sup>1</sup> Extension Agronomist, Texas AgriLifeResearch & Extension Center, Amarillo, phone: 806-677-5600, Email: [b-bean@tamu.edu](mailto:b-bean@tamu.edu).

<sup>2</sup> Extension or Research Assistants or Associates, Texas AgriLife Research and Extension Center, Amarillo.

<sup>3</sup> Director of Crop Testing, Texas AgriLife Research, College Station, Phone: 979-845-8505, Email: [croptesting@tamu.edu](mailto:croptesting@tamu.edu).

NDF:	Neutral Detergent Fiber; cell wall fraction of the forage
ADF:	Acid Detergent Fiber; constituent of the cell wall includes cellulose and lignin; inversely related to energy availability
NEL:	Estimate of Net Energy for lactation
NEM:	Estimate of Net Energy for maintenance
NEG:	Estimate of Net Energy for gain
IVTD:	In Vitro True Digestibility; positively related to energy availability
NDFD:	Neutral Detergent Fiber Digestibility, digestible NDF, %: This is a measure of fiber digestibility that is determined from the IVTD analysis.
RFV:	Relative Feed Value is an index for comparing forages based on digestibility and intake potential. RFV is calculated from ADF and NDF. An RFV of 100 is considered the average score and represents alfalfa hay containing 41% ADF and 53% NDF on a dry matter digestibility.
RFQ:	Relative Forage Quality is an index for comparing forages. RFQ is calculated from CP, ADF, NDF, fat, ash and NDF digestibility measured at 48 hours. It should be more reflective of the feeding value of the forage. RFQ is based on the same scoring system as RFV with an average score of 100. The higher the RFQ, the better the quality.
Milk lbs/ton:	A projection of potential milk yield per ton of forage dry matter.

## Results and Discussion

A summary of yield and nutrient composition for the first cutting is reported in Table 1. Entries were grouped by BMR and PS type. Stand establishment was good with all hybrids. The first cutting was made on August 4<sup>th</sup> and 5<sup>th</sup>, 75 days after planting. This was a few days later than when we generally make our first harvest. Sorghum growth was delayed due to the extreme heat and drought experienced during June and July. At the time of harvest, average plant moisture was 70% and only a few hybrids had reached the heading stage. Dry matter yield ranged from a low of 1.25 ton/acre with Sweeter N Honey BMR to a high of 2.46 ton/acre with Sordan II. The test mean was 1.8 ton/acre.

When comparing hybrid types, the nonBMR hybrids averaged 2.04 ton/acre, while the BMR entries averaged 1.76 ton/acre, or 13.7 % less. The PS BMR hybrids had a similar average yield (1.75 ton/acre) to the BMR hybrids. Average digestibility was slightly less with the nonBMR hybrids compared to the BMRs based on % IVTD and % NDFD.

Variability in the yield data was somewhat high in the second cutting, resulting in no significant differences at the P=0.05 level (Table 2). However, yield ranged from a low of 1.42 ton/acre with Sweeter N Honey BMR to a high of 3.11 ton/acre with Sordan Headless. The nonBMR and PS BMR hybrids on average yielded about 0.3 ton/acre more than the BMR hybrids. There were no major differences in forage digestibility with the exception of the sudan hybrid Trudan 8 which had a significantly lower % IVTD and % NDFD than the test mean. The lower digestibility of Trudan 8 was likely because its maturity was further along than the others with 50% of the plants headed at the time of harvest.

The average total seasonal yield was 4.15 ton/acre. Six hybrids yielded more than 4.7 ton/acre (Figure 1). These were Sordan 79 (5.1 ton/acre), AS453 (4.91 ton/acre), Sordan Headless (4.81 ton/acre), AS6501 (4.75 ton/acre), Grazex III (4.73 ton/acre) and Trudan 8 (4.73 ton/acre).
